

Subject: Understanding of Reporting Requirements and Target Solution

Hi [Recipient],

As per my understanding:

- Jayanta's team currently generates ~10 weekly/monthly reports manually.
- Data is exported from the SAP application in XLSX format.
- Some manual data cleansing is performed.
- No SQL is used to generate these reports.

As per the current state of the AWS pipeline:

- Some Glue jobs are running only to copy Clean air tables' data into Redshift schemas (SAP → S3 → Bronze → Silver → Gold layers).
- No report logic has been implemented in stored procedures.
- No reports are being generated at this stage.
- Currently, the teams are only validating record counts between AWS and SAP.

To move forward, we first need to:

1. Identify how many tables and data points are required to be pulled from SAP into S3 through the Theobald tool.
2. Define the joining logic for the SAP tables that will be used to generate the reports.

Once this is clarified, we can align the pipeline design accordingly.

Key Challenges Identified:

1. **SAP Access:** Access to the required SAP systems and tables is pending, which may delay data extraction.
2. **Report Logic:** The business logic and joining rules for generating the reports are not fully defined/clarified yet.

Please confirm if my understanding is correct, or let me know if any adjustments are needed.

Subject: Next Steps for Report Automation

Hi [Recipient],

To move forward, we first need to:

3. Identify how many tables and data points are required to be pulled from SAP into S3 through the Theobald tool.
4. Define the joining logic for the SAP tables that will be used to generate the reports.

Once this is clarified, we can align the pipeline design accordingly.

Key Challenges Identified:

3. **SAP Access:** Access to the required SAP systems and tables is pending, which may delay data extraction.
4. **Report Logic:** The business logic and joining rules for generating the reports are not fully defined/clarified yet.

Please confirm if my understanding is correct, or let me know if any adjustments are needed.

"The main challenges we see are, first, pending SAP access, and second, the report logic, especially the joining rules across SAP tables. Once these are resolved, we can move faster with the pipeline development."
